

Web Platform Specification

A complete product, engineering, and design specification for xcreativs.com — the public face and operating layer of XCreativs Technologies.

DOCUMENT: Web Platform Specification (PRD)

VERSION: 1.0

DATE ISSUED: 15 May 2026

PREPARED BY: Office of the Founder, XCreativs Technologies

PREPARED FOR: Chief Technology Officer, XCreativs Technologies

STATUS: Approved for build

CLASSIFICATION: Internal · Confidential

1. Executive Summary

XCreativs Technologies is an intelligent digital systems holding company that builds high-value systems for governments and enterprises, creates and owns defensible intellectual property through XCreativs Labs, and spins out scalable products into subsidiaries. The firm has shipped over fifteen business-grade web platforms, is currently engaged on two flagship mandates — the 24H+ Authority Intelligence Architecture for the 24-Hour Economy Authority of Ghana and the ILIVVON health intelligence platform for Fastcare Clinics — and is approaching a phase of national-scale work.

The current xcreativs.com cannot carry the firm into that phase. It must be replaced with a web platform that does six jobs at once: it signals seriousness to governments and enterprises evaluating XCreativs for mission-critical mandates; it qualifies inbound prospects through structured intake; it runs active client engagements as managed workspaces inside the platform; it hosts XCreativs Labs products and routes the world to ILIVVON; it recruits talent; and it publishes the firm's thinking as an authority engine.

This document is the complete specification for that platform. It is organised into ten functional layers — from the public surface, through lead qualification and the authenticated client portal, into the partner workspace, careers, knowledge layer, interactive tools, and the cross-cutting features (search, AI concierge, bilingual support, accessibility, performance). It also defines the design system, the recommended technology stack, the phased delivery plan, and the acceptance criteria against which the build will be measured.

The objective is not a brochure website. The objective is a platform that becomes infrastructure the firm cannot operate without, and that clients cannot reproduce elsewhere. The site must demonstrate the seriousness it sells.

2. Strategic Intent & Positioning

2.1 What the platform must signal

XCreativs Technologies is positioned, in its own operating documentation, as a strategic and ownership layer that delivers intelligent digital systems to governments and enterprises, builds national-scale platforms through Labs, and owns multiple technology businesses over time. The website is the most public artefact of that positioning. Every visitor decision — from a procurement officer assessing fitness, to an investor evaluating valuation trajectory, to a future hire deciding whether to apply — passes through it.

The platform must therefore signal four things, immediately and without ambiguity. First: this is a serious firm, operating at the altitude of national infrastructure, not a software agency. Second: the firm produces and owns its intellectual property, and Labs is a real arm with real products. Third: the firm has shipped — fifteen-plus engagements is not a claim, it is a portfolio. Fourth: engagement is by qualification, not by enquiry.

2.2 Three audiences, three jobs

The platform serves three distinct audiences. The decisions taken at every level of information architecture must consider all three.

Prospective clients	Governments, enterprises, and large institutions evaluating XCreativs for a mandate. They need to assess credibility quickly, see relevant precedent in their sector, and have a frictionless route to a qualified conversation.
Active clients	Organisations XCreativs is currently engaged with — including the 24-Hour Economy Authority and Fastcare Clinics. They need a single authenticated workspace that holds every artefact, decision, milestone, and conversation related to their engagement.
The wider ecosystem	Partners, co-development collaborators, investors, journalists, regulators, and prospective hires. They need to understand the holding-company structure, read the firm's thinking, and engage on terms appropriate to their role.

2.3 What this platform is not

To prevent scope drift during the build, several explicit non-goals are recorded here.

- It is not a brochure. Pages that exist purely to be read and never to be acted upon are demoted to secondary navigation.
- It is not a dashboard for client-owned data. Surfaces that look like live intelligence dashboards (e.g., the Donor Intelligence Engine of the 24H+ AIA) belong to client engagements, not to the firm's website. The firm's website shows the firm's data about itself — engagement count, capability lattice, reading list, sectoral mix.
- It is not an open marketplace. Engagement is by qualification. Below-threshold prospects are routed gracefully — not converted aggressively.
- It is not a one-time build. The platform must be architected for continuous additions — Labs products as they emerge, subsidiaries as they spin out, case dossiers as engagements close.

3. Design System

3.1 Colour palette

The palette is restricted by design. Three tokens carry every interface decision. The discipline is the point: a small palette used precisely outperforms a wide palette used loosely, especially on a site that must read as serious.

TOKEN	HEX	USE
Signal blue	#0066CC	The firm's signal. Reserved for accents, status indicators, primary CTAs, key links, section markers, data emphasis, and the chrome of live indicators. It must never become decorative. It must always carry meaning.
Foundation	#FFFFFF	The page foundation across the public surface. Generous white space is the dominant compositional move. The public site is light-first by default.
Gravity	#000000	Typographic gravity. The colour of all body type, headings (where not blue), and key data points. Also the foundation of the authenticated client portal, where dense data benefits from a dark interface.

Neutral greys (e.g., #DDDDDD for hairline rules, #F4F7FB for soft surfaces) are derivative and used sparingly for borders, hairlines, table backgrounds, and dividers. They are not part of the brand palette; they exist only to support the three primary tokens. No additional colours are introduced without explicit founder approval.

3.2 Typography

One typeface, used at scale, in disciplined sizes, across the entire platform: Inter Tight. It is the sole face for every word on every surface — display, body, navigation, captions, code, metadata, forms, charts, and authenticated dashboards. There are no font fallbacks except for system-safe defaults in case the typeface fails to load. There are no decorative typefaces. There are no secondary typefaces.

Inter Tight, everywhere, no exceptions. The discipline of a single typeface used precisely is itself a brand signal.

Type scale (recommended)

- **Display.** 64–96px / 1.0 line-height / -0.03em letter-spacing. Bold or semibold. Used once per page, never more.
- **H1.** 40–48px / 1.05 / -0.02em. Bold.
- **H2.** 28–32px / 1.15 / -0.01em. Bold.
- **H3.** 20–24px / 1.25 / 0. Bold or semibold.
- **Lead.** 18–20px / 1.55 / 0. Regular or medium.
- **Body.** 16px / 1.6 / 0. Regular. The dominant size across the site.

- **Caption / metadata.** 12–13px / 1.4 / 0.04em. Uppercase, regular weight, used for section markers, labels, and chrome.

3.3 Motion

Motion is restrained, deliberate, and information-bearing. It exists to reveal hierarchy, guide attention, and confirm interaction — never as decoration. The platform must respect the user's prefers-reduced-motion preference at all times.

- Page-load orchestration. One coordinated, staggered reveal per page on first paint. Subsequent navigations are crisp without overwhelming entrance animation.
- Scroll-driven storytelling. The home page, case dossiers, Labs product pages, and the long-form theses are built as scroll-revealed narratives — text fades in, charts animate to their values, comparative numbers count up on viewport entry.
- Page transitions. Smooth, fast (180–240ms), and consistent across the App Router. Built with Motion library / Framer Motion.
- Hover micro-interactions. Subtle card lifts, underline reveals on links, colour shifts from black to signal blue. Never noisy.
- Live tickers. The engagement count and capability deployment ticker animate when their value updates. No idle animation.
- Interactive diagrams. The holding-company tree, the Services→Labs→Subsidiaries value flow, and the Meadows leverage hierarchy are interactive on hover and click.
- Cursor state. Subtly shifts by surface — denser and more deliberate in the authenticated portal, lighter and more spacious in the public surface.

3.4 Iconography & imagery

- Icons. Lucide or a custom set, consistent stroke weight, all rendered at the same baseline size. No mixing of icon libraries.
- Imagery. Real screens of platforms built, real photography of the team, no stock photography. Where illustration is required (e.g., the holding-company tree diagram), it is custom-commissioned to a single style.
- Charts. Restrained, monochromatic where possible, signal blue used only to highlight the data point that carries meaning. No gradient-filled charts. No 3D effects.

3.5 Layout

- 12-column responsive grid, with explicit breakpoints for mobile ($\leq 640\text{px}$), tablet (641–1024px), desktop (1025–1440px), and wide ($>1440\text{px}$).
- Maximum content width of 1440px on wide displays, with comfortable internal padding. The site never stretches edge-to-edge.
- Hairline rules visible across pages, used as architecture rather than ornament. Section markers (§ 01, § 02) employ a monospaced register within Inter Tight via numeric tabular figures.
- Asymmetric layouts permitted and encouraged for editorial pages (home, thinking, case dossiers). Symmetric layouts for utility pages (forms, dashboards, settings).

4. Information Architecture

The platform is organised as ten functional layers. Each layer has a defined purpose, a set of features, and an explicit relationship to the others. The first eight layers are user-facing; the last two are cross-cutting concerns that span the entire platform.

4.1 Layer map

Layer 01	Public surface — the firm's identity, services, Labs, subsidiaries, case dossiers, industries, insights, careers, press, contact.
Layer 02	Lead qualification & intake — the structured replacement for the contact form.
Layer 03	Client portal — the authenticated workspace where active engagements are managed, document by document, decision by decision.
Layer 04	Partner & collaborator portal — for co-ownership, co-development, distribution, and referrals.
Layer 05	Careers & talent — roles, application tracking, the talent network, internships.
Layer 06	Knowledge & publishing — field notes, theses, whitepapers, the annotated bibliography, the glossary of practice, audio brief.
Layer 07	Interactive tools & public utilities — readiness assessments, scope estimators, the document-intelligence demo, the capability lattice explorer, the holding-company visualiser.
Layer 08	Cross-cutting features — universal search, AI concierge, bilingual EN/FR, currency switcher, dark/light, accessibility, performance, SEO, analytics, notifications, PWA, audit logging.
Layer 09	Design & motion system — already specified in §3.
Layer 10	Foundational technology — already specified in §10.

4.2 Public sitemap

- Home (/)
- About (/about) — mission, principles, founder bios, leadership, advisory, timeline, reading list.
- Services (/services) — overview, plus a deep page per service line:
 - Digital Systems Audit & Architecture (/services/audit)
 - Enterprise & Government System Development (/services/enterprise)
 - AI & Automation Integration (/services/ai)
 - Strategic Web & Digital Platforms (/services/digital)
 - Strategy, Advisory & Thought Leadership (/services/advisory)
- Labs (/labs) — overview, operating loop, platform pages:
 - ILIVVON Health Intelligence Platform (/labs/ilivvon)
 - Additional platforms (/labs/[slug]) — as they emerge.

- Subsidiaries (/subsidiaries) — overview plus per-subsubsidiary pages.
- Case Dossiers (/work) — filterable index, with /work/[slug] for each engagement.
- Industries (/industries) — overview, plus /industries/[sector] for each.
- Insights (/insights) — index, plus /insights/[slug] for each note/thesis/whitepaper.
- Careers (/careers) — overview, role list, /careers/[role], application tracker.
- Press (/press) — releases, media coverage, media kit.
- Contact (/contact) — the structured intake hub described in §6.
- Legal (/legal/terms, /legal/privacy, /legal/security, /legal/data-residency).

4.3 Authenticated sitemap (post-login)

- Portal home (/portal) — overview of the user's engagements.
- Engagement workspace (/portal/engagements/[id]) — and beneath it:
 - Dashboard, deliverables, decisions, stakeholders, risks, lattice, budget, invoices, approvals, comms, demos, reports, team, activity, support, settings, audit log.
- Partner workspace (/portal/partners) — for co-development and distribution partners.
- Account (/portal/account) — profile, security, MFA, notifications, API keys.
- Admin (/portal/admin) — internal XCreativs use only; user management, content management, analytics, audit.

5. Layer 01 · Public Surface

Every page in the public surface must demonstrate the firm's altitude. The standard pages exist, but each is engineered beyond brochure.

5.1 Home

A scroll-driven narrative built from a sequence of editorial blocks: hero positioning → live engagement ticker → interactive holding-company tree → services snapshot → Labs preview → selected case dossiers → quote/manifesto block → engage CTA. Each section animates in on scroll, with a single coordinated page-load reveal.

- Hero. A one-line positioning statement set at display scale, with a secondary lead paragraph and two primary calls to action: 'See the work' and 'Engage'.
- Live engagement ticker. Number of active engagements, sectors covered, capabilities deployed, drawn from the firm's internal record and updated in real time.
- Holding-company tree. An interactive diagram of the parent → Services / Labs / Subsidiaries structure. Click any node to drill into details.
- Services snapshot. The five service lines surfaced as a tile grid, each linking to its deep page.
- Labs preview. ILIVVON foregrounded, with the operating loop explained in three to four lines.
- Selected case dossiers. Three to five hand-picked dossiers, rotated periodically.
- Manifesto block. A single editorial paragraph in larger type, anchoring the firm's philosophy.
- Engage CTA. A single, deliberate call to begin a qualified conversation.

5.2 About

Mission, operating principles, the leverage-points philosophy after Donella Meadows, founder bios with real depth, leadership team, advisory board, the firm's annotated reading list, and a public timeline of milestones. Investors and procurement officers read this page; it must reward them.

5.3 Services

The five service lines, each with its own dedicated page rather than a marketing card.

Digital Systems Audit & Architecture	The core entry service. A structured engagement that audits a client's digital posture and produces an architecture for the next eighteen-to-thirty-six months. Page covers methodology, deliverables, indicative timeline, indicative price band, sample dossiers, FAQ, tailored intake CTA.
Enterprise & Government System Development	Selective, not open. Mission-critical builds for institutions. Page describes engagement model, technology posture, security and compliance approach, governance, indicative phasing, and sample dossiers.
AI & Automation Integration	The intelligence layer. Page describes capabilities (document intelligence, workflow automation, predictive layers, copilots), constraints (data sovereignty, evaluation), and sample dossiers.

Strategic Web & Digital Platforms	Transitional, controlled. Page makes the firm's position clear: web platforms are taken where they earn strategic position, not as agency work. Includes the fifteen-plus existing portfolio.
Strategy, Advisory & Thought Leadership	The authority engine. Page describes retainer model, advisory boards XCreativs sits on, publication track record, and how to engage.

5.4 Labs

The IP arm given its own architecture. The Labs overview explains the operating loop — Mandate → Build → License → Spin out — and lists the platforms in development. Each platform is treated as a real product.

- ILIVVON. Full product site nested inside /labs/ilivvon: problem, platform, screens, technical architecture overview, sectors served, request-access form. Treated as a first-class product, not a case study.
- Subsequent platforms. Each new Labs product gets its own /labs/[slug] page on the same template.

5.5 Subsidiaries

A page that maps the future of the holding — what subsidiaries exist (planned, in formation, active), their relationship to the parent, their leadership, and their status. Today it might show ILIVVON Health Systems Ltd as 'in formation.' Over time, it grows into a real portfolio page.

5.6 Case Dossiers

Engagements rendered as declassified-brief format: brief, constraint set, architecture chosen, what shipped, what was retained as IP, what was learnt. Filterable by sector, service line, scale, and stage. Anonymised where confidentiality requires. The fifteen-plus existing engagements seed the index; future engagements are added as they close.

5.7 Industries

A dedicated page for each sector in which XCreativs operates — Government, Health, Financial Services, Insurance, Retail/Commerce, Energy, Education, NGO/Development. Each industry page describes how the firm's capability lattice maps to that sector's problems, surfaces relevant case dossiers, and offers an industry-specific intake CTA.

5.8 Insights

A single library that holds three content types: short field notes (~500 words, dense, operational), long-form theses (10,000–20,000 words, gated download), and whitepapers (formal, sector-specific). Each item is taggable, searchable, dated, author-attributed, and RSS-syndicated.

5.9 FAQ

Real questions grouped by category — engagement model, pricing, IP, government work, timelines, team composition, security and compliance, post-launch. Not a marketing FAQ; a working reference.

5.10 Press / Newsroom

Press releases, media coverage, the media kit (logos, brand assets, executive headshots, founder bios), the press contact, awards & recognition, speaking engagements, and a downloadable one-pager about the firm.

6. Layer 02 · Lead Qualification & Intake

The contact form, as a primitive, is retired. It is replaced by a structured intake system that qualifies prospects, protects the firm's time, and gives serious enquirers a serious route to a conversation.

6.1 Engagement Readiness Diagnostic

A branching 8-to-12 question intake. Topics include: who you are, the brief, mission criticality, sovereignty constraints, sector, budget signal, decision authority, timeline, and internal capability. The diagnostic branches dynamically based on answers.

Outputs an indicative routing — Services / Labs collaboration / Government Digital Excellence Initiative / decline-with-referral — and a one-page PDF summary of the routing decision, indicative scope, and indicative next steps.

6.2 Project Scope Estimator

A configurator. Visitor picks service line, answers five-to-eight parameters, and receives an indicative set of components, a weeks-band, a price-band, and a sample architecture. This is not a quote; it is a signal that the firm understands the brief. The lead is captured and sent to sales with the configuration attached.

6.3 RFP / Tender Submission Portal

Government bodies and enterprises uploading formal RFPs and tenders through a structured intake that auto-captures deadline, scope, evaluation criteria, contact details, and submission requirements. Routed internally to whoever owns that vertical, with SLA-tracked acknowledgement.

6.4 Book a Reading

Calendar booking for an initial conversation, gated by completion of the diagnostic. Different conversation durations and routing for different qualification outcomes. Integrates with Google Calendar / Microsoft 365 on the XCreativs side.

6.5 NDA + MoU auto-issue

Once a prospect passes a qualification threshold, the system auto-issues a non-disclosure agreement (and, where requested, a memorandum of understanding template) via an e-signature flow (DocuSign or Dropbox Sign). Signature status is tracked in the CRM.

6.6 Graceful decline & referral path

Below-scope prospects receive a thoughtful redirect — named alternatives in the firm's network, useful resources (relevant insights articles, a starter guide), and an opt-in to be contacted if circumstances change. This protects reputation and preserves future option value.

6.7 Newsletter signup with segmentation

Visitors choose what they want to hear about — sector updates, Labs releases, hiring news, thought pieces. Different cadences for different segments. Built on a transactional email platform (Resend or SendGrid) with full preference management.

7. Layer 03 · Client Portal

This layer is the single highest-leverage move on the entire platform. Once active clients log in to manage their engagement from inside xcreativs.com, the switching cost compounds every month they use it. This is the 'infrastructure clients cannot remove' thesis applied to the firm itself.

Each active engagement gets a workspace at `/portal/engagements/[id]` — or, for clients who require it, under the client's own subdomain with a white-labelled identity. The workspace is the operating layer of the engagement. Every document, decision, milestone, risk, conversation, and approval lives inside it.

7.1 Authentication & access

- Authentication. Email/password plus single sign-on (Google, Microsoft). Multi-factor authentication mandatory for all users.
- Role-based access. Three default roles per workspace: Executive (board-pack altitude, read-only on operational detail), Project (full operational view, can comment and approve), and Viewer (read-only).
- Audit log. Every access event recorded with timestamp, user, IP, action, and resource. Exportable by the client.
- White-label mode. Workspaces can be hosted under the client's own domain with the client's logo, colours, and email-from address. Built from day one — not retro-fitted.

7.2 Engagement workspace modules

Each engagement workspace contains the following modules, accessible from a persistent left-hand navigation.

Dashboard	The top-level view. Phase status, milestone progress, current sprint, this-week's focus, open blockers, recent activity feed. Live.
Deliverables Vault	Every document XCreativs has produced for the client, versioned, with signature status, diff viewer between versions, download history, and role-based visibility on each document.
Decision Log	Every material decision made in the engagement, time-stamped, with rationale, alternatives considered, decision-maker, and linked artefacts. The sovereign-grade audit trail. Worth its weight on its own — clients cannot reproduce it elsewhere.
Stakeholder Map	Visual graph of who is involved on both sides, who decides what, who has been briefed, who has not. Editable. Useful for executives and project leads.
Risk Register	Open risks, owner, mitigation plan, residual rating, escalation status. Filterable by severity and status. Linked to decisions.
Capability Lattice Tracker	What has been delivered, what is in flight, what is queued, what has been deferred and why. Mapped to the firm's standard capability map.

Budget & Milestone Tracker	For milestone-paid engagements: burn against budget, milestones invoiced, milestones outstanding, currency exposure (USD vs GHS), forward forecast.
Invoices & Payments	Invoice generation, status, payment links via Stripe and Paystack. Currency: USD, GHS, and (where relevant) EUR.
Approval Workflows	Deliverables sent for sign-off; approver routing; conditional approval; rejection with comments. Asynchronous, fully audited.
Threaded Comms	Discussions on every deliverable, decision, and risk. Notifications and email digests. Not Slack — this lives inside the workspace, archived, owned by the engagement record.
Embedded Demos	For engagements where XCreativs is building platforms (e.g. 24E-IIMP, ILIVVON, any of the existing fifteen-plus builds), the live preview environment is embedded inside the workspace. Single sign-on, no context switching.
Reports Library	Quarterly reviews, status memos, board-pack exports, technical handover documents, post-engagement reports. Searchable, exportable, role-scoped.
Document Library	Onboarding materials, runbooks, contracts, NDAs, SLAs — kept distinct from the deliverables vault. The reference shelf for the engagement.
Team Directory	Who at XCreativs is on this engagement, their role, contact details, availability status.
Activity Feed & Notifications	In-app activity stream plus email (and optionally WhatsApp / SMS for executives). Configurable per role and per user.
Support Tickets	Clients raise issues, request changes, ask questions. SLA-tracked with response targets visible to the client.
Settings & Access Control	Clients manage their own users, roles, permissions, and notification preferences within their workspace.
Audit Log	Every action recorded — every document view, every comment, every approval, every change. Exportable for the client's own compliance review.

7.3 Multi-engagement view

Clients with multiple engagements — large enterprises and government bodies operating across several mandates — see all their engagements in a unified portal home. They switch between workspaces without re-authentication.

7.4 API access

Sophisticated clients receive scoped API keys to pull their engagement data into their own systems — deliverables, decisions, milestones, audit log. This is itself a sovereignty signal: the client owns their data and can extract it at any time.

7.5 Offline & low-bandwidth mode

Critical for Ghana network realities. The portal is delivered as a Progressive Web App, installable on mobile and desktop. Key views are cached aggressively; the application degrades gracefully on poor connectivity. Document downloads queue and resume.

8. Layer 04 · Partner & Collaborator Portal

Per the firm's Product Collaboration & Co-Ownership Model, XCreativs grows by collaborating with existing products that solve real problems but lack intelligence, scale, or distribution. The partner portal is the operating layer for those relationships.

8.1 Partnership Application

Prospective partners apply through a structured intake: existing product, domain, traction, what they need from XCreativs (intelligence, scale, distribution), what they bring (product, expertise, users). Application is routed internally and tracked.

8.2 Active Partner Dashboard

For partners with co-owned products: joint product status, development progress, revenue share visibility, IP ownership tracker, partnership agreement vault, scheduled reviews, escalation paths.

8.3 Co-Development Workspace

Mirror of the client workspace structure, adapted for joint builds — shared deliverables, shared decisions, shared risk register, joint approval workflows. Both parties have equal visibility; XCreativs retains audit and admin rights.

8.4 Referral Programme

Tracks referrals coming in, conversion status, and referral fees or equity arrangements where agreed. Visible to the referring partner.

8.5 Distribution Partner Layer

For organisations distributing Labs products — for example, a regional partner taking ILIVVON into a new market: orders, training, regional performance, commission tracking, support ticket routing.

9. Layer 05 · Careers & Talent

Not a job board. A serious-firm recruiting tool, designed to attract senior practitioners and emerging talent who want to work on national-scale systems.

9.1 Roles Open

Each role rendered as a full page: what the role is, what the candidate will work on (with real project examples, anonymised where required), who they will work with, compensation philosophy, growth trajectory, application process, expected start window.

9.2 Application Tracking

Candidates submit applications and track their status — received, under review, interview scheduled, offer, decline — with automated updates at each transition. Email confirmations on every state change.

9.3 Talent Network

An always-open route for senior practitioners. 'No role fits but you want to be known to us' — candidates express interest by domain (engineering, AI/ML, design, product, strategy, public policy) and are notified when a fitting role opens.

9.4 Technical Assessments

For engineering and design roles, optional skill-aligned challenges integrated into the application. Designed to be fair, brief, and revealing.

9.5 Internship & Fellowship Programme

Structured paths for emerging talent in Ghana and West Africa. Three-month internships and six-month fellowships, with defined learning outcomes and clear conversion pathways.

9.6 Inside XCreativs

Day-in-the-life content, team perspectives, principles, how-we-work documentation. Used both to attract talent and to onboard new joiners.

10. Layer 06 · Knowledge & Publishing

The firm publishing as an authority engine — the operating expression of the Strategy, Advisory & Thought Leadership service line, but as continuous infrastructure rather than periodic slides.

10.1 Field Notes

Short, dense, well-edited operating notes from the work. Five-hundred-to-one-thousand words. Anonymised where confidentiality requires. Author-attributed. Two-to-four published per month.

10.2 Long-form Theses

Quarterly or biannually. Ten-to-twenty-thousand words on a single system — for example, 'The architecture of intelligent government in West Africa' or 'Donor-capital infrastructure in the African development decade.' Distributed as gated, qualified downloads. Available as PDF, executive summary, and audio.

10.3 Whitepapers

Sector-specific, branded, formal. Used as door-openers for new sectors and as substantive collateral in enterprise sales conversations.

10.4 Annotated Bibliography

A living document of what the firm reads. Each entry includes the citation, a substantive annotation, and a link. Builds the intellectual signature of the firm and serves as a public reading list for clients and candidates.

10.5 Glossary of Practice

Define the language the firm uses — leverage points, embedded vs engaged, capability lattice, sovereign-by-default, intelligent digital systems. Outsiders learn the language; insiders become loyal.

10.6 Audio Brief

Long-form thinking read aloud and distributed as an audio feed. Useful for executives in transit. Embedded on the relevant insights pages and available as a standalone podcast feed.

10.7 Webinars & Events

Registration, calendar, replays, attendee follow-up. Integrates with the CRM so attendees are segmented for future communications.

11. Layer 07 · Interactive Tools & Public Utilities

Public-facing tools that demonstrate capability and capture qualified leads. None of these depend on client data; they are configured from the firm's domain expertise and the firm's own operating data.

Digital Systems Readiness Assessment	Fifteen-to-twenty questions on the visitor's current digital posture. Output: readiness score across five dimensions (architecture, data, AI maturity, security, governance), with recommended next steps mapped to XCreativs services. Lead capture at the result.
AI Maturity Score	Targeted at enterprises asking whether they are ready for AI. Outputs a maturity tier, gap analysis, and recommendations.
Tech Debt Estimator	For organisations with legacy systems. Inputs: system age, technologies, integration count, change frequency. Output: indicative debt rating and a starting point for remediation.
Document Intelligence Demo	Visitor drops in a non-sensitive document (an RFP, a policy doc, a contract). The tool returns structured extraction — entities, dates, obligations, summary. Capped usage to prevent abuse. A public demonstration of the firm's capability.
Capability Lattice Explorer	Interactive grid mapping all of the firm's capabilities against all sectors served. Click any intersection to see how the firm would approach it, with case precedent.
Holding Company Visualiser	Animated, interactive map of the parent → Services / Labs / Subsidiaries structure. Click any node to drill into details. Brings the operating-design document to life on the public site.
Value Flow Animation	The Services → Labs → Subsidiaries value loop, animated. Hover over each stage for an explanation drawn from the operating-design document.
Project Configurator	Pick a service line, answer five-to-eight questions, receive an indicative set of components, weeks-band, and price-band. The Scope Estimator from Layer 02, surfaced as a public tool.
Engagement Cost Calculator	Indicative pricing for common scopes, with toggles for complexity, urgency, team size, and sovereignty constraints.
Live Engagement Counter	Number of active engagements, total deliverables in flight, sectors covered, capabilities deployed. Drawn from the firm's own internal record, updated in real time. Provides the live, intelligent texture of the public site without depending on any client's data.

12. Layer 08 · Cross-cutting Features

Features that span every layer of the platform. None of these are negotiable for a build of this seriousness.

12.1 Universal search

A single search box that, for unauthenticated visitors, searches across the public pages, case dossiers, field notes, theses, whitepapers, and glossary. For authenticated users, search extends into their own workspace — deliverables, decisions, risks, comments. Search is fast (sub-200ms), typo-tolerant, and ranked.

12.2 AI Concierge

A branded conversational assistant, named 'XC Assistant,' that answers questions about services, projects, scheduling, and routes complex queries to the right team. Built on the firm's own document corpus — no hallucinated capability claims. Available across the public site, with deeper integration in the client portal for authenticated users.

12.3 Bilingual EN / FR

English by default; French as a first-class second language, fully translated across the public surface and the client portal. Important for Francophone West African expansion and for working with multilateral institutions.

12.4 Currency switcher

USD / GHS / EUR (and additional currencies as needed) across pricing, scope estimates, and the budget tracker in the client portal.

12.5 Dark / Light mode

The public surface is light-first (#FFFFFF foundation, #000000 typographic gravity, #0066CC signal). The authenticated portal defaults to a dark mode (#000000 foundation, #FFFFFF type, #0066CC signal) because dense operational data benefits from a low-light interface. Both modes use the same three brand tokens.

12.6 Accessibility

WCAG AA minimum across the entire platform. Keyboard navigation fully supported; screen-reader-tested on each release; prefers-reduced-motion respected; colour contrast verified; semantic HTML throughout; ARIA used sparingly and correctly.

12.7 Performance

Lighthouse score of 95 or higher on all four metrics (Performance, Accessibility, Best Practices, SEO) on every public page. Image optimisation, edge caching, instant page transitions, lazy loading on images and embeds, prefetching on link hover.

12.8 SEO

Structured data (JSON-LD) on every entity — organisation, services, articles, case dossiers, products, people. Comprehensive sitemap.xml, robots.txt, og:image automation, canonical URLs, schema.org markup, and clean URL structure throughout.

12.9 Analytics

Internal analytics dashboard for the XCreativs team: visitors, intake conversion rates, content performance, client-portal usage, conversion funnels. Privacy-respecting — no third-party data leakage where avoidable. Built on Plausible or PostHog (self-hosted option available).

12.10 Notifications

A unified notifications system across email, in-app, and (optionally) WhatsApp / SMS, with per-user preferences and digest options. The same system serves visitors (newsletter), prospects (intake follow-up), clients (workspace activity), partners (joint product updates), and candidates (application status).

12.11 Progressive Web App

The entire platform is installable as a Progressive Web App on mobile and desktop. The client portal is offline-first for the key views: dashboard, deliverables, decisions, risks. Documents downloaded in the portal are cached for offline reference.

12.12 Multi-region performance

Content delivery network with edge presence in Ghana and West Africa as priority regions, with global reach for international clients and partners.

12.13 Audit logging

Comprehensive audit logging across the client portal, partner portal, and admin layer. Exportable in machine-readable formats (CSV, JSON) for client and internal compliance reviews.

13. Recommended Technology Stack

Recommendations, not mandates. The CTO retains final authority on stack choices. The recommendations below have been selected for production seriousness, hiring availability in Ghana and the region, and operational simplicity.

Frontend framework	Next.js 14+ (App Router) with TypeScript. Server-side rendering for the public surface, client-side interactivity for the portal.
Styling	Tailwind CSS, with a strict design-token configuration that surfaces only the three brand colours and Inter Tight as the sole typeface.
Motion	Motion library (formerly Framer Motion) for React. CSS-only for simple cases; Motion for orchestrated scroll-driven and shared-element transitions.
Forms & validation	React Hook Form with Zod schemas. Server actions for submission. All forms validated client and server side.
Backend & data	PostgreSQL (Supabase or Neon). Prisma ORM. Next.js Route Handlers and Server Actions for API endpoints. Redis (Upstash) for sessions, rate limiting, and short-lived caches.
Authentication	Clerk or NextAuth, with multi-factor authentication mandatory for authenticated layers, single sign-on for Google and Microsoft, and SAML/OIDC for enterprise clients on request.
Content management	Sanity or Payload CMS. The content team must be able to update field notes, case dossiers, services, team bios, and press releases without engineering involvement.
File storage	S3-compatible object storage (Cloudflare R2 or AWS S3) for the deliverables vault. Versioned, signed-URL access, role-scoped retrieval.
Transactional email	Resend or SendGrid for transactional email and newsletter delivery.
Payments	Stripe (international) plus Paystack (Ghana). Single payments and milestone-based invoicing.
E-signature	DocuSign or Dropbox Sign API for NDAs, MoUs, and engagement letters.
Analytics	Plausible or PostHog. Self-hosted option available for sovereignty-conscious clients.
Observability	Sentry for errors. Axiom or BetterStack for logs and tracing. Status page on a separate subdomain.
Hosting	Vercel for the Next.js frontend; Supabase or Neon for the database; Cloudflare R2 for storage. Self-hosted alternative on Hetzner or DigitalOcean available if procurement demands.

AI / ML services	OpenAI or Anthropic for the XC Assistant. Document intelligence may use the same providers or self-hosted models depending on the document sensitivity.
Search	Algolia or Typesense (self-hosted) for universal search. Postgres full-text for the portal-internal search.
Internationalisation	next-intl for bilingual EN/FR. Translation strings managed in the CMS.

14. Phased Delivery Plan

Three phases. Each phase is independently shippable. Each phase earns the next. Attempting all three at once is the most likely failure mode for a build of this scope.

14.1 Phase A — six to ten weeks

Foundation. The public surface in full, plus the intake system, plus core cross-cutting features. On its own, this is already miles ahead of any comparable firm in Ghana.

- Layer 01 — public surface in full (home, about, all services pages, Labs landing, ILIVVON product page, subsidiaries, fifteen-plus case dossiers, industries, FAQ, contact, press).
- Layer 02 — engagement readiness diagnostic, project scope estimator, RFP intake, calendar booking, NDA auto-issue, newsletter.
- Layer 05 — careers landing and role pages (without the full applicant tracker).
- Layer 06 — Insights index, field notes, theses with gated download, glossary.
- Layer 08 — universal search (public scope), EN/FR, dark/light, PWA, SEO, analytics, accessibility, performance.

14.2 Phase B — eight to sixteen weeks (overlapping with Phase A from week six)

Infrastructure. The client portal in full. The first clients — the 24-Hour Economy Authority engagement and the Fastcare engagement — go live on it. This is the phase that turns the site from website into infrastructure.

- Layer 03 — authentication, MFA, role-based access, audit log, workspace dashboard, deliverables vault, decision log, stakeholder map, risk register, capability lattice tracker, budget and milestone tracker, invoices and payments, approval workflows, threaded comms, embedded demos, reports library, document library, team directory, activity feed, support tickets, settings.
- Layer 03 — white-label mode.
- Layer 05 — full applicant tracking.
- Layer 08 — notifications system, audit logging across portal.

14.3 Phase C — twelve to twenty-four weeks (overlapping with Phase B from week sixteen)

Compounding. The partner layer, the interactive public tools, the AI concierge, and the API. The phase that makes the platform unforkable.

- Layer 04 — partner application, active partner dashboard, co-development workspace, referral programme, distribution partner layer.
- Layer 07 — all interactive tools and public utilities.
- Layer 08 — AI Concierge across public site and portal.
- Layer 03 — API access with scoped keys for sophisticated clients.
- Layer 06 — annotated bibliography, audio brief, webinars.

15. Acceptance Criteria & KPIs

Each phase is accepted against measurable criteria. Subjective criteria (aesthetic quality, brand fitness) are reviewed by the founder; objective criteria are measured automatically.

15.1 Objective acceptance criteria

- Lighthouse score of 95 or higher on Performance, Accessibility, Best Practices, and SEO on every public page.
- WCAG AA conformance verified by automated tooling and at least one manual screen-reader pass per page.
- Time-to-first-byte under 200ms from Accra; Largest Contentful Paint under 1.8s on a representative 4G connection.
- Zero high-severity vulnerabilities in production at any time (verified by automated security scanning on every deployment).
- Uptime of 99.9% measured monthly across the public surface and the client portal.
- Multi-factor authentication enforced for every authenticated user with no exception.
- Audit log captures one hundred percent of writes and one hundred percent of authenticated reads in the client portal.

15.2 KPIs (post-launch, reviewed monthly)

- Qualified leads per month via the engagement readiness diagnostic. Baseline target: ten per month within ninety days of Phase A launch.
- Diagnostic completion rate. Target: above forty percent of starts.
- Client portal weekly active users (per engagement). Target: at least three distinct users per active engagement per week.
- Time-to-first-portal-access for a new engagement. Target: workspace provisioned and credentials issued within forty-eight hours of engagement letter signature.
- Insights subscriber growth. Target: one hundred new qualified subscribers per month after Phase A launch.
- Document Intelligence demo conversion to qualified lead. Target: ten percent of completions.

16. Risks, Constraints, and Open Questions

16.1 Risks to manage during the build

- Scope creep. The most common failure mode for a build of this scope. The three-phase plan exists specifically to absorb scope pressure into Phase C rather than Phase A.
- Premature client onboarding. Live clients should not be onboarded to the portal until Phase B is fully production-tested. A poor early experience for a live client is a strategic loss; a delayed Phase B is recoverable.
- Authentication and security mistakes. The client portal carries real commercial and reputational risk. The Authentication and audit components of Phase B must be reviewed by an external security practitioner before any client is onboarded.
- Performance degradation in Ghana. International stacks default to performance in North America and Europe. The build must be benchmarked against the Ghanaian network reality, not the Lighthouse-default network reality.
- Brand drift through implementation. The discipline of Inter Tight, three colours, and a restrained motion system is easy to articulate and easy to lose in execution. A weekly design review during the build is mandatory.

16.2 Open questions for resolution before Phase A kick-off

- Final decision on CMS — Sanity or Payload.
- Final decision on authentication provider — Clerk or NextAuth — based on enterprise SSO requirements of the first wave of clients.
- Domain strategy — does xcreativs.com remain the single domain, or are subdomains used for the portal (portal.xcreativs.com) and Labs (labs.xcreativs.com)? Recommendation: single domain, path-based structure, for now.
- White-label workspaces — for the 24-Hour Economy Authority and Fastcare specifically, are workspaces hosted at xcreativs.com or at a client-owned subdomain? Founder decision required by Phase B week one.
- AI Concierge — bring forward into Phase A or hold for Phase C? Default position: Phase C.
- Sovereignty — does any current or near-term client require on-shore hosting (data resident in Ghana)? If so, the hosting choice shifts from Vercel to a self-hosted equivalent.

17. Approval & Sign-off

This document is approved for build as version 1.0. Material changes after sign-off are handled through a change-control note appended to this document, signed by both the founder and the CTO.
